Project Description
EduFlex is a school management system developed using ASP.NET Core with the MVC (Model-View-Controller) framework. It is a web-based platform specifically designed to optimize and simplify various administrative tasks within schools. With features such as student, teacher, and course management, as well as modules for tracking attendance, grades, and other critical data, EduFlex offers comprehensive solutions for school administrators. The system's primary users will be administrators, providing them with a centralized and efficient interface to manage day-to-day school operations. EduFlex aims to enhance workflow, reduce manual tasks, and ensure accurate record-keeping, ultimately contributing to more effective school management.
